

Graphs

- $G = (V, E)$
- V is the vertex set.
- Vertices are also called nodes and points.
- E is the edge set.
- Each edge connects two different vertices.
- Edges are also called arcs and lines.
- Directed edge has an orientation (u, v) .

Graphs

- Undirected edge has no orientation (u, v) .

- Undirected graph \Rightarrow no oriented edge.
- Directed graph \Rightarrow every edge has an orientation.

Undirected Graph

Directed Graph (Digraph)

Applications—Communication Network

- Vertex = city, edge = communication link.

Driving Distance/Time Map

- Vertex = city, edge weight = driving distance/time.

Street Map

- Some streets are one way.

Complete Undirected Graph

Has all possible edges.

Number Of Edges—Undirected Graph

- Each edge is of the form (u,v) , $u \neq v$.
- Number of such pairs in an n vertex graph is $n(n-1)$.
- Since edge (u,v) is the same as edge (v,u) , the number of edges in a complete undirected graph is $n(n-1)/2$.
- Number of edges in an undirected graph is $\leq n(n-1)/2$.

Number Of Edges—Directed Graph

- Each edge is of the form (u,v) , $u \neq v$.
- Number of such pairs in an n vertex graph is $n(n-1)$.
- Since edge (u,v) is not the same as edge (v,u) , the number of edges in a complete directed graph is $n(n-1)$.
- Number of edges in a directed graph is $\leq n(n-1)$.

Vertex Degree

Number of edges incident to vertex.

$$\text{degree}(2) = 2, \text{degree}(5) = 3, \text{degree}(3) = 1$$

Sum Of Vertex Degrees

$$\text{Sum of degrees} = 2e \text{ (e is number of edges)}$$

In-Degree Of A Vertex

in-degree is number of incoming edges

$$\text{indegree}(2) = 1, \text{indegree}(8) = 0$$

Out-Degree Of A Vertex

out-degree is number of outbound edges

$$\text{outdegree}(2) = 1, \text{outdegree}(8) = 2$$

Sum Of In- And Out-Degrees

each edge contributes 1 to the in-degree of some vertex and 1 to the out-degree of some other vertex

sum of in-degrees = sum of out-degrees = e ,
where e is the number of edges in the digraph

Graph Operations And Representation

Sample Graph Problems

- Path problems.
- Connectedness problems.
- Spanning tree problems.

Path Finding

Path between 1 and 8.

Path length is 20.

Another Path Between 1 and 8

Path length is 28.

Example Of No Path

No path between 2 and 9.

Connected Graph

- Undirected graph.
- There is a path between every pair of vertices.

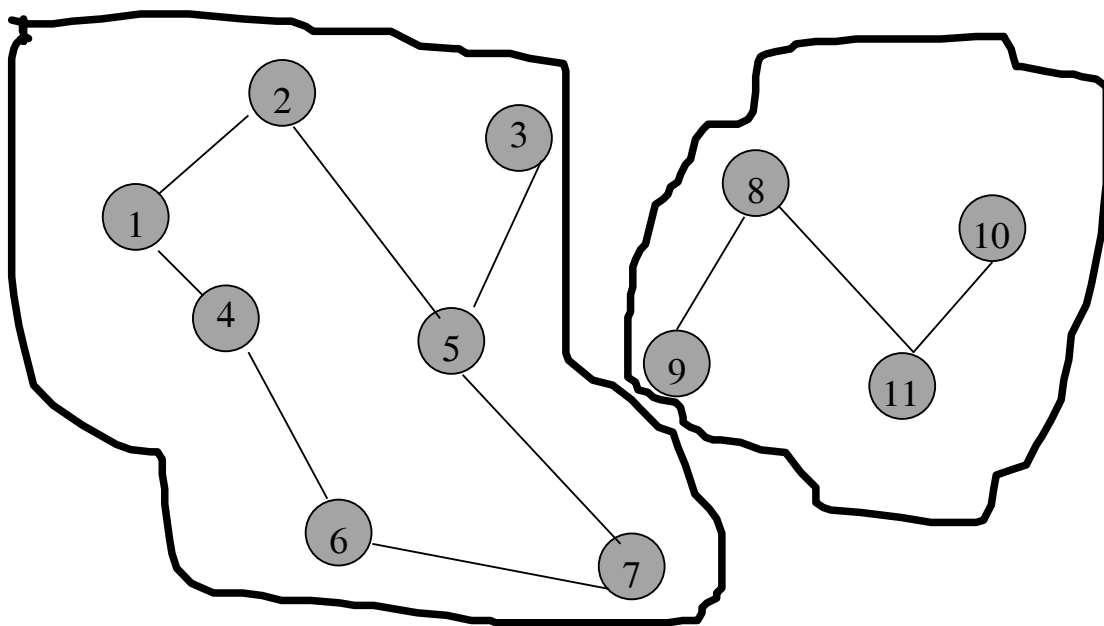

Example Of Not Connected

Connected Graph Example

Connected Components

Connected Component

- A maximal subgraph that is connected.
 - Cannot add vertices and edges from original graph and retain connectedness.
- A connected graph has exactly 1 component.

Not A Component

Communication Network

Each edge is a link that can be constructed (i.e., a feasible link).

Communication Network Problems

- Is the network connected?
 - Can we communicate between every pair of cities?
- Find the components.
- Want to construct smallest number of feasible links so that resulting network is connected.

Strongly connected for a digraph

- For every pair u, v in the graph
 - there is a directed path from u to v and v to u .

In Class Exercise

- Is this graph a strongly connected one?

Cycles And Connectedness

Removal of an edge that is on a cycle does not affect connectedness.

Cycles And Connectedness

Connected subgraph with all vertices and minimum number of edges has no cycles.

Tree

- Connected graph that has no cycles.
- n vertex connected graph with $n-1$ edges.

Spanning Tree

- Subgraph that includes all vertices of the original graph.
- Subgraph is a tree.
 - If original graph has n vertices, the spanning tree has n vertices and $n-1$ edges.

Minimum Cost Spanning Tree

- Tree cost is sum of edge weights/costs.

A Spanning Tree

Spanning tree cost = 51.

Minimum Cost Spanning Tree

Spanning tree cost = 41.

A Wireless Broadcast Tree

Source = 1, weights = needed power.

Cost = $4 + 8 + 5 + 6 + 7 + 8 + 3 = 41$.

Graph Representation

- Adjacency Matrix
- Adjacency Lists
 - Linked Adjacency Lists
 - Array Adjacency Lists

Adjacency Matrix

- 0/1 $n \times n$ matrix, where $n = \#$ of vertices
- $A(i,j) = 1$ iff (i,j) is an edge

	1	2	3	4	5
1	0	1	0	1	0
2	1	0	0	0	1
3	0	0	0	0	1
4	1	0	0	0	1
5	0	1	1	1	0

Adjacency Matrix Properties

	1	2	3	4	5
1	0	1	0	1	0
2	1	0	0	0	1
3	0	0	0	0	1
4	1	0	0	0	1
5	0	1	1	1	0

- Diagonal entries are zero.
- Adjacency matrix of an undirected graph is symmetric.
 - $A(i,j) = A(j,i)$ for all i and j .

Adjacency Matrix (Digraph)

	1	2	3	4	5
1	0	0	0	1	0
2	1	0	0	0	1
3	0	0	0	0	0
4	0	0	0	0	1
5	0	1	1	0	0

- Diagonal entries are zero.
- Adjacency matrix of a digraph need not be symmetric.

Adjacency Matrix

- n^2 bits of space
- For an undirected graph, may store only lower or upper triangle (exclude diagonal).
 - $(n-1)n/2$ bits
- $O(n)$ time to find vertex degree and/or vertices adjacent to a given vertex.

Adjacency Lists

- Adjacency list for vertex i is a linear list of vertices adjacent from vertex i .
- An array of n adjacency lists.

aList[1] = (2,4)

aList[2] = (1,5)

aList[3] = (5)

aList[4] = (5,1)

aList[5] = (2,4,3)

Linked Adjacency Lists

- Each adjacency list is a chain.

Array Length = n

of chain nodes = $2e$ (undirected graph)

of chain nodes = e (digraph)

Array Adjacency Lists

- Each adjacency list is an array list.

Array Length = n

of list elements = $2e$ (undirected graph)

of list elements = e (digraph)

Weighted Graphs

- Cost adjacency matrix.
 - $C(i,j)$ = cost of edge (i,j)
- Adjacency lists => each list element is a pair (adjacent vertex, edge weight)

Number Of C++ Classes Needed

- Graph representations
 - Adjacency Matrix
 - Adjacency Lists
 - Linked Adjacency Lists
 - Array Adjacency Lists
 - 3 representations
- Graph types
 - Directed and undirected.
 - Weighted and unweighted.
 - $2 \times 2 = 4$ graph types
- $3 \times 4 = 12$ C++ classes

Homework

- Section 6.1 Exercise 2,3,4 @P339
